Abstract

This project is aimed at creating a fully working online hairdresser booking system. The development starts from gathering requirements as specified during project meetings. In the first six weeks of development, a working prototype is created in order to verify and validate the outcome with the requirements. Prior to project completion, the testing phase is performed to check the web application for bugs and errors. When all the findings has been identified and fixed, the web application can be put into production, which is on the actual web hosting. The project can be accessed on http://www.sulendra.com/HBS/
