PREDICTION & IDENTIFICATION OF IPO RAISED FUNDS UTILIZATION: AN INDONESIAN PERSPECTIVE

Josephine 0800785386

Abstract

Objectives
The main objective of this research is to empirically examine the utilization of the funds by the IPO companies in Indonesia, whether to finance future growth and/or to enhance financial flexibility. Moreover, the objective of this study is to identify whether a relationship exists between the growth opportunity pre-condition of a company and the use of IPO funds to finance future growth, and between the financial constraint pre-condition of a company and the use of IPO funds to enhance financial flexibility.

Method
In order to do so, the author investigates the listed companies in the Indonesia Stock Exchange (IDX) that conducted IPO within year 2000 and 2005. The author develops four hypotheses, and then analyzes the data using Kolmogorov-Smirnov Test, One-Sample T Test, Binomial Test, and Multiple Regression Analysis.

Results
The results revealed that Indonesian companies that conducted IPO during the period of 2000 to 2005 utilize the IPO funds to finance future growth rather than to enhance financial flexibility. Even, strong evidence occurred that these companies, in the periods following their IPOs, issued more long term debt in order to support the investments for future growth. Moreover, growth opportunity is found not to have significant effects in determining the utilization of IPO fund to finance future growth in the form of working capital requirement. However, it is proven to highly affect the future growth investment in the form of long term one such as PPE, one year after the IPO. Finally, financial flexibility is found not to have significant effects on both the liquidity and solvency position of the IPO companies since those IPO companies did not lower the leverage but rather make it higher.
